

Proof Statement

I build practical machine learning pipelines that turn messy search and business data into actionable recommendations, helping engineering managers and data teams prioritize high-impact work instead of relying on intuition. Through my portfolio, I demonstrate how I frame real business problems, analyze data, build and evaluate ML models, and present results that support better decisions. If you're looking for someone who can contribute to applied machine learning projects with a structured, evidence-based approach, I'd like you to review my work and contact me to discuss internship or entry-level ML opportunities.

Why this needs to exist

A CV or LinkedIn profile can list my skills and projects, but they cannot demonstrate how I think through an end-to-end machine learning problem, justify technical decisions, and translate model outputs into useful business actions.
